Here's my outline so far. Still very much a work in progress. I want to get your thoughts on the structure.

- Part 1 - Human learning
    - Intro
        - Learning is one of the most critical determinants to our professional success, personal growth, and satisfaction
        - With the pace of change in technology, there's an increasing need to learn new skills more quickly. Especially with machine learning and AI becoming more and more commonplace.
        - We can speed up how we learn new skills by learning strategies for learning.
        - What we intend to do in this ATS is show both how humans learn and how machines learn along with strategies for both. After discussing learning at the individual / machine level, we'll talk about how we can more effectively learn at the organizational level and then how we can tie all of this together in our projects to have more effective human / machine collaboration.
    - How humans learn
        - Neuroplasticity
        - Chunking
        - Focused vs diffuse mode
        - Forest (big picture) vs trees (detail)
        - Environment - sleep, focus, stress
    - Techniques for learning
        - Recall
        - Applied learning
        - Direct practice
        - Behavioral (soft skills) vs technical learning (hard skills)
    - Pitfalls
        - Lack of focus or sleep, stress
        - Illusion of learning
        - Not applying learning
        - Tunnel vision - details, not big picture
        - Not learning the right thing, over learning
    - Interaction / Exercise
        - Feynman technique - Write down a concept and explain it as clearly and as simple as possible. If it's a concept you know well, elaborate with an example. If it's a new concept, write what you know. After doing this, evaluate your weak points and make a note to fill in the gaps. Discuss your results with your breakout.
- Part 2 - Machine Learning
    - How AI learns
    - Techniques to help learning

- Pitfalls
- Interaction / Exercise

- Part 3 - Organizational and team learning
  - Lessons learned
  - Kaizen - continuous improvement, feedback
  - Agile retrospectives
  - Complexity
    - Systems thinking
    - Design thinking
  - Pitfalls
    - Pressure to just get it done, not taking time to reflect
    - Lessons learned don't go anywhere or get applied throughout the organization, teams don't look back
    - Culture - willingness to receive critical feedback
    - Groupthink
  - Interaction
    - Discuss improvement methods used in your company
- Part 4 - Applying human / machine learning to projects
  - Compare / contrast human vs machine learning
  - Human / machine collaboration
  - How can we apply these techniques to our projects?
